CO2: Display and verify the mean of a real-life Project using the concepts of C# Graphical User Interface based environment with database integration to depict a desktop-based application.

Assessment Criteria	Not Attended/ Incorrect (0)	Inadequate (1-2)	Average (3)	Good (4)	Excellent (5)
Evaluation Criteria	Evaluation Definition				Total =
Requirement fulfillment	Properly demonstrate a real-life scenario-based project with proper functional requirement identification for the Object-Oriented Programming project development activities.				
Validation	Ensuring the ability of students' proper demonstration on validation forms in their system in terms of dealing with the data.				
Verification	Identifying if the students can verify the system data along with proper functional requirements in terms of data flow.

- 7)In Future Project Upgrade Planning
- 8)Conclusion

Introduction

MCQ Vault is a project developed by .NET 7 windows form application(Winforms) where students answer to Multiple Choice question created by Authors in order to make themselves better at analytical thinking, sharpening basics and solving conceptual questions .

In this project Multiple students can interact with multiple types of modules. A module consists of number of questions that are hosted by Authors . Each Author have different identity . Students have to search for module name in order to attend the practice examination .

The system was designed with multiple diagrams . Initially in this report, a pictorial demonstration is added in order to get basic impression about the project . After that Multiple diagrams were drawn for example ER Diagram for Database, Use case diagram for visualization of actors and automated systems ,Class Diagram for the System sturcture and lastly state chart Diagram for the Dynamic Behaviour of the System .

After Diagram Demonstration,pictures of every form were added of both Examiner and Author Part .

At the end some discussions for example benefits of this project,future planning and Conclusion were added in order to complete an ending of a report .

Benefits

Centralized Question Bank: Educators and institutions can securely store, organize, and retrieve large volumes of multiple-choice questions in one dedicated system rather than scattered files.

Streamlined Test Assembly: The integrated construction module (`ConstructMod`) allows examiners to quickly pull from the vault to generate new exams without having to re-type or manually format questions.

Role-Based Access Control: With distinct portals for different users (`AuthorHP`, `ExaminerHP`) and secure authentication (`LoginPage`, `SignupPage`), the system ensures that only authorized personnel can view or alter sensitive exam content.

Efficient Revisions: The editing module (`EditMod`) allows for rapid corrections to questions or distractors (wrong options) without needing to overhaul entire test papers.

Automated Assessment: Delivering the test through the `Examination` module allows for immediate, automated grading, drastically reducing the manual workload on teachers and eliminating human grading errors.

Future Planning

Cloud Database Migration: Transitioning the local data storage to a cloud-hosted relational database (e.g., Azure SQL or AWS) to allow real-time, remote access for authors and students across different locations.

Advanced Analytics & Reporting: Implementing data visualization dashboards for examiners to track student performance trends, identify overly difficult questions, and analyze class averages.

Web or Mobile Integration: Upgrading the Windows desktop architecture to a web-based application or cross-platform mobile app to increase accessibility for students taking exams on diverse devices.

Anti-Cheating Mechanisms: Adding secure examination features, such as browser-lockdown modes, randomized question shuffling, or randomized option orders to maintain test integrity.

Multimedia Support: Upgrading the question construction tools to support image, audio, and video embeds within the MCQ prompts and options.

Conclusion

The MCQ Vault project successfully delivers a structured, role-based platform designed to modernize the management of multiple-choice examinations. By compartmentalizing question authoring, editing, and test execution into dedicated modules, the application significantly reduces the administrative burden on educational staff. With its robust foundational features including secure user authentication and dedicated examiner workflows the project provides a highly scalable solution that streamlines the traditional testing process and establishes a strong framework for future educational technology enhancements.
